

AGMS — Adaptive (Power) Grid Management System — Architecture & Interconnection (six-patent family)

Solid = data-object flow (perceive → reason → command → execute)
Red dashed = feedback / resupply loops
Grey dashed = cross-cutting influence

Cross-Cutting Systems — threads woven through every layer

Learning Engine — the spine
retrieval & adaptation from history:
ranks CAPs • matches CaCSM patterns
• matches DNA schemas • picks POV
patterns • recalibrates states live

Simulate-before-commit — a law
CaCSM promotion (GA) • operation
loop formation [granted claim 3]
• ORACS verification simulation.
Never actuate on an unvalidated plan.

Data Management / POV files
sole interface to the asset DB — no
module touches raw data. Role-filtered
views via patterns DB + Learning Engine:
• viewConstructModule (observe)
• controlConstructModule (actuate)
• adminConstructModule (coordinate)
GridWideEye builds PoV frames.

Security in the protocol
every inter-module message carries a
ga-authenticationkey, validated by a
ga-GateKeeper before any state machine
activates or data is released.
gAVA standardizes the message schema
so all modules speak one language.

Federation & autonomy spectrum (oft)
ioc.cc independent, supports central cmd
ioc.sc fully autonomous cell
ioc.coc member of cooperating neighbors
ioc.fm sub-federation member
Cells merge / federate under a scout-master.
